

Improving on Best Practices:
Lessons from an FHT-based
client-centred e-mental health
project

Presenters Disclosure

- Kelly Buchanan is the Executive Director of the Huron community Family Health Team.
- Robert Shepherd is a practicing clinical psychologist, an employee of one of the Huron community Family Health Team, and a Co-Founder of Myndplan Inc.

Potential For Conflicts of Interest

- Dr. Shepherd's blend of personal and professional interests implies numerous conflicts of interest of the sort that can bias judgment and distort the kind of information that makes up the following content.
- Specifically, Dr. Shepherd developed, licenses, distributes and benefits from sales related to a service that is discussed in this presentation: Myndplan Inc.

Mitigating Bias

- Dr. Shepherd will limit his focus to discussion of data derived from a prototype evaluation study and related work in the Huron community FHT
- He will not make direct recommendations regarding Myndplan

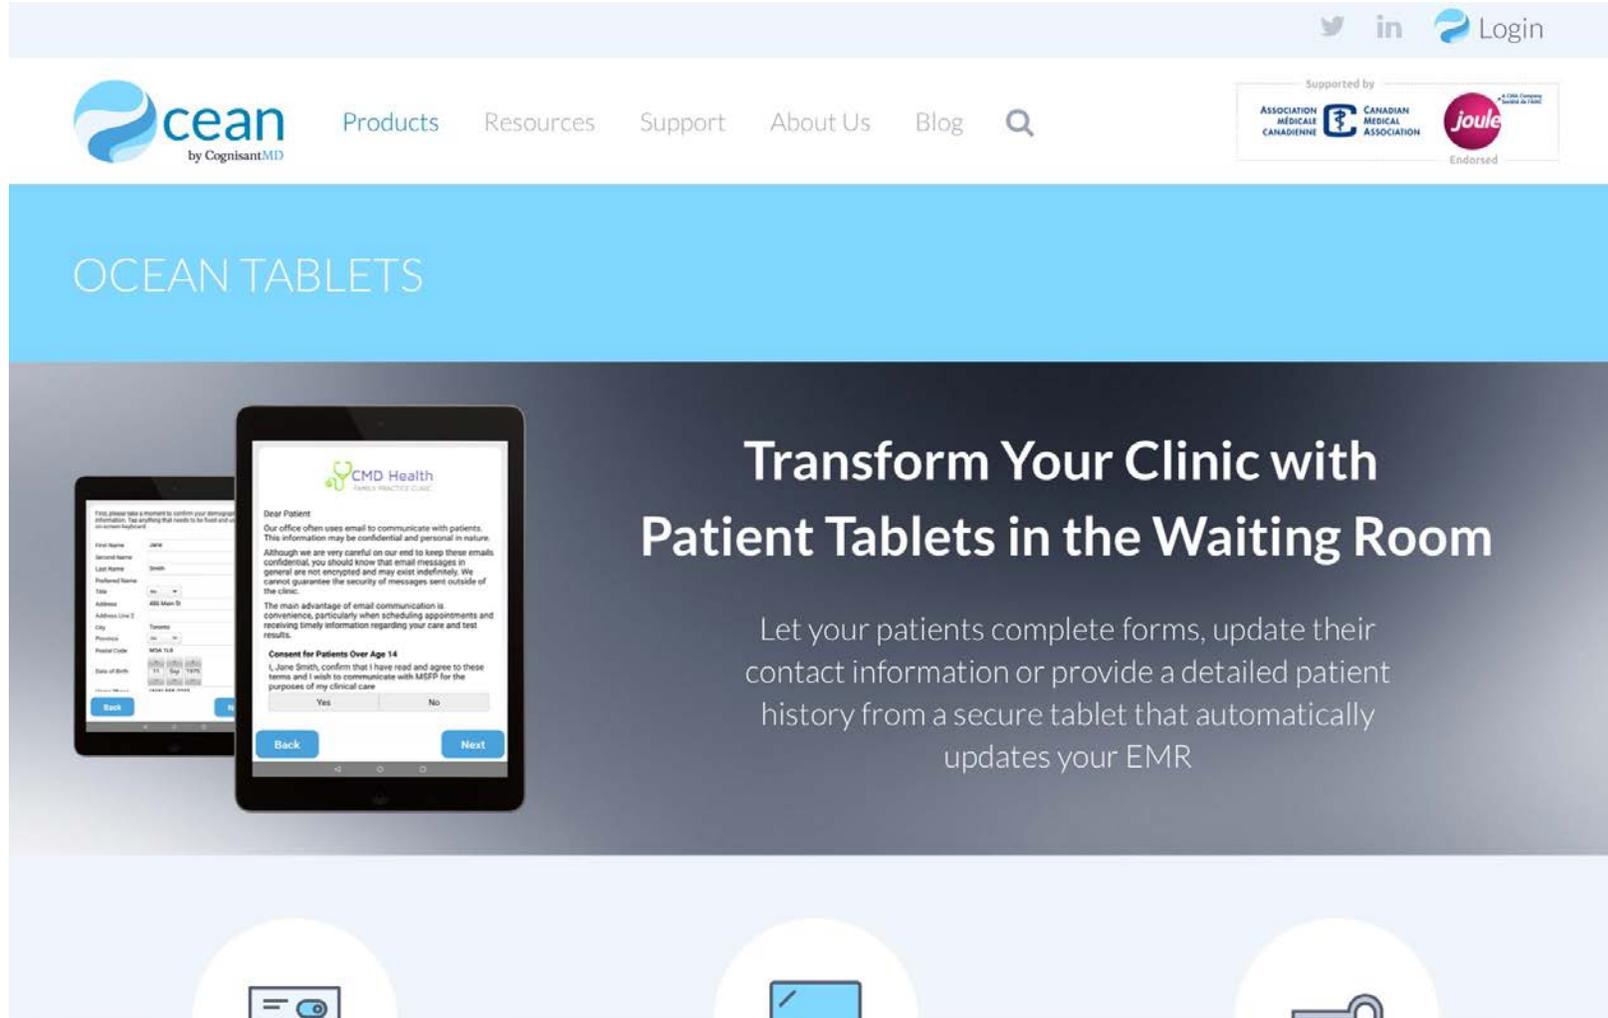

Challenges in primary care mental health

- The quick screens we use typically over-diagnose problems like anxiety and depression, and overlook most other diagnoses
- Many treatments lack empirical validation
- Physicians can be quick to prescribe and slow to discontinue antidepressant medication, regardless of efficacy
- Mental health providers persist with ineffective methods indefinitely
- Most providers rarely measure patient outcomes
- Most providers rarely assess the therapeutic alliance
- E-mental health resources are underutilized
- Mental health agencies often create silos that limit collaboration

E-Mental Health Resources offer a solution to many of these problems

- Research is emerging that suggests e-resources actually work
- E-resources are often more convenient and cost-effective to use than paper-and-pencil or face2face services
- Examples include
 - Screening to identify mental health problems
 - Online counseling services
 - Online apps and other treatment tools

Screening tools are quickly gaining popularity

The screenshot shows the Ocean Tablets website interface. At the top right, there are social media icons for Twitter, LinkedIn, and a 'Login' button. Below these is the 'cean by CognisantMD' logo and a navigation menu with links for 'Products', 'Resources', 'Support', 'About Us', and 'Blog'. To the right of the navigation is a 'Supported by' section featuring logos for the 'ASSOCIATION MÉDICALE CANADIENNE', 'CANADIAN MEDICAL ASSOCIATION', and 'joule', with an 'Endorsed' label. The main header is a light blue bar with the text 'OCEAN TABLETS'. Below this, two tablets are displayed. The left tablet shows a patient registration form with fields for 'First Name', 'Last Name', 'Medical Name', 'Sex', 'Address', 'City', 'Province', 'Postal Code', and 'Date of Birth'. The right tablet shows a 'Dear Patient' message from 'CMD Health FAMILY PRACTICE CLINIC' with a consent form for patients over 14. The main content area has a dark grey background with the headline 'Transform Your Clinic with Patient Tablets in the Waiting Room'. Below the headline is the text: 'Let your patients complete forms, update their contact information or provide a detailed patient history from a secure tablet that automatically updates your EMR'. At the bottom, there are three circular icons: a tablet with a form, a tablet with a pen, and a key.

OCEAN TABLETS

Transform Your Clinic with Patient Tablets in the Waiting Room

Let your patients complete forms, update their contact information or provide a detailed patient history from a secure tablet that automatically updates your EMR

Screening Pros & Cons

- PHQ-9, GAD-7 are the most common for mental illness
- CAGE, DAST-10 for addiction
- Services like Ocean are convenient, integrate with EMR

- Rely on public domain tools
- Cannot handle more complex algorithms and transformations
- Tend to over-diagnose, self-screening may not be beneficial without follow-up

Online counselling is also gaining a foothold

Online Counselling Pros & Cons

- Multiple formats are available
 - Messaging, Live chat, Live phone, Live video
- Can be funded through 3rd party benefit providers
- As effective as face2face

- Many services recruit uncertified/unlicensed counsellors to save \$
- Most regulated professionals must respect regional boundaries
- Advertising and billing practices may fail to meet professional standards

Online self-help is well established

 [Frequently Asked Questions](#)

Online self-help pros and cons

- Many are using empirically validated techniques
- Wide range of costs
 - free (Antidepressant Workbook)
 - modest (MoodGym 39\$)
 - expensive (Sleepio 300\$)
- Evidence suggests they are as good as face2face counseling
- Some can only be accessed through corporate sponsors (Workguru)
- Many are completely ineffective
- Most are “gamified” – can exploit vulnerable populations

The Myndplan Beta Prototype Project

- Inspired by a Health Technologies Fund call for submissions
- Required a health technology business to collaborate with a health institution
- Goal is to support home and community care through virtual, digital and mobile health care technologies that connect services
- Combined Huron community FHT resources with prototype software developed by Myndplan inc.

PSYCHOLOGICAL SERVICES

Alzheimer Society
HURON COUNTY

Early Results: Utilization

- 7 clinicians registered 40% of total client sample
- 1 intake worker registered 60% of total client sample
 - Twice as many chose paper and pencil version
 - As many as 50% drop out during registration process
- Myndplan workshops saw 83% of participants register

Retention

- Onboarding: the more an individual has support and a personal stake in the change process the more likely they are to make use of the service
- Happy Churn: No matter how useful the service, without a reason to return no one will come back
- Clinician Churn: Anything that requires extra time or energy will not be utilized
- Utility over content: People really really like anything that saves them time and effort

Lessons Learned

- Clients like having access to assessment results
- User experience is critical: must be easy to use or will fail
- Messaging and peer support is over-rated
- Clinicians want symptom monitoring and treatment support
- But...Clinicians hate criticism, can't say no, & are bad scientists
- Clients want help understanding diagnosis and building treatment plan – knowledge translation is the key to real change
- Neuroscience that is not rocket science can give a powerful boost to knowledge transfer efforts

Scan Data

- Transdiagnostic: Most problems fall within 5 main clusters
- Simple screens can predict treatment response or resistance
 - Flexibility 10x better outcomes
 - Intrusive Thoughts, Irritability 2-3x poorer outcomes
- Data can also be used to accurately discriminate between healthy adults, typical clients, and addiction clients

Monitor Data

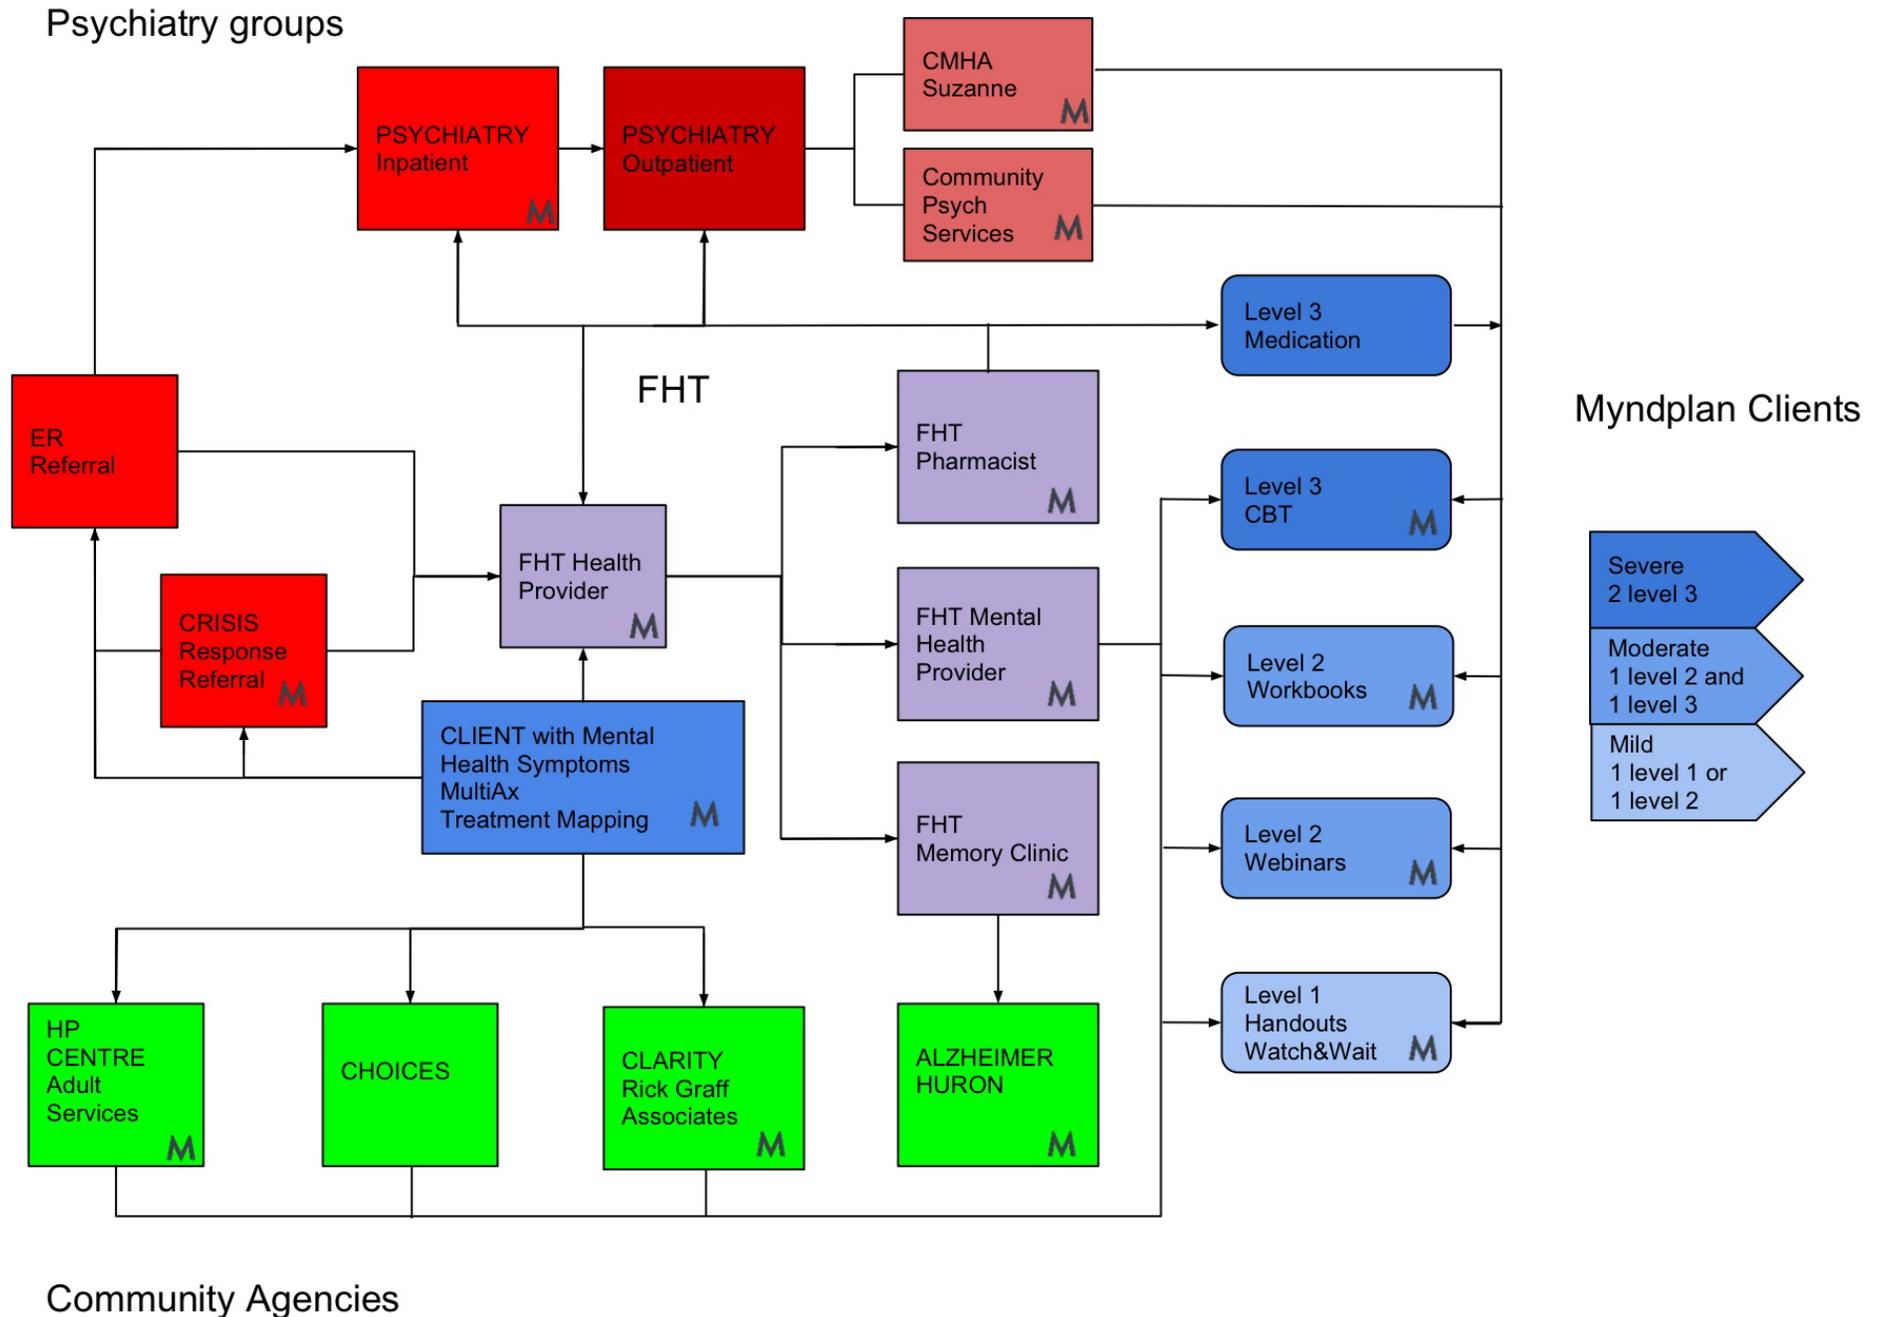

- The average client will improve .5 points per session
- Initial monitor scores indicate severity and predict level of final monitor scores
- Average change from session to session can be quantified and used to estimate progress or worsening of key symptoms
- Variance of change from session to session can be used to estimate volatility
- Final monitor score can help predict termination readiness
- Frequent sessions + shorter duration of therapy = better outcomes

Clinical Insights

- Almost all referrals to primary care mental health professionals, and in private practice, involve more than one diagnosis
- Many referrals have been on at least one antidepressant medication, often in combination with a benzodiazepine, for years
- Many of the rest are prescribed medication prior to starting counselling
- Very few clients have an appropriate diagnosis
- Providers will continue ineffective treatment indefinitely
- Providers tend to stick to a single treatment modality

Treatment Process Map

Technology can help create a stepped model of treatment in a broader circle of care

GUIDE

Most professionals consider 2 or more of the above problems to be a pretty reliable indication that alcohol abuse is a serious problem. While that may not seem like a lot, each item on its own is actually a pretty serious warning sign, so even a couple are enough evidence to suggest that your drinking is out of control.
